

Flood & Water Logged Trees

Recommended program to maximise recovery of trees in flood affected areas.

The following programs have been shown to maximise recovery of trees in these area:

Established blocks - flood affected trees:

500g/ha MicroPlus + 1.5L/ha Vitazyme via irrigation at green tip or with weed spray;

Repeat Vitazyme (1.5L/ha) as foliar sprays at first flower, petal fall, 30 days later, 30 days prior to harvest (5 treatments including one via irrigation)

Repeat MicroPlus 6-8 weeks after initial treatment.

Humus 26 5L/ha; monthly via irrigation; up to 20-25L/ha

Re-plants (within established blocks)

Tree dip 175g/20L MicroPlus; plus 1% Vitazyme solution (can be mixed)

Follow up Drench trees with - 0.5-1g/tree MicroPlus + 1-2ml/tree Vitazyme monthly; 2-3 applications

Powerful beneficial microbes that naturally colonise and shield the plant root system.

- Colonises roots and stays in the soil
- Competes strongly with other microbes
- Mixes with ag- chemicals & fertilisers
- Healthier plants

Contact us for international research.

Testimonial - "I thought I would have to remove my apple tree replants until one soil drench with MicroPlus" (Neil Davies - Shepparton)

Contains biological "activators" that stimulate trees to increase chlorophyll, & other growth substances, resulting in more energy & more growth, whilst reducing the effect of environmental stress.

Brassinosteroids & Triacntanol in Vitazyme have been shown to improve crop growth and development plus induce tolerance to stress. (contact us for international research papers).

Concentrated liquid humic acid (with potassium)

- Improves soil structure
- Stimulates soil biology
- Retains nutrients in the soil
- Promotes soil drainage

Check with us to fine tune these programs to your specific situation.
